Preface xiii

SECTION I

TOWARDS EDWARD JENNER’S REVENGE: DEVELOPING AN EFFECTIVE TUBERCULOSIS VACCINE / 1

A. BASIC IMMUNOLOGY

1 Innate Immune Responses to Tuberculosis / 3
   Jeffrey S. Schorey and Larry S. Schlesinger

2 Cytokines and Chemokines in Mycobacterium tuberculosis Infection / 33
   Racquel Domingo-Gonzalez, Oliver Prince, Andrea Cooper, and Shabaana Khader

3 Regulation of Immunity to Tuberculosis / 73
   Susanna Brighenti and Diane J. Ordway

4 The Memory Immune Response to Tuberculosis / 95
   Joanna R. Kirman, Marcela I. Henao-Tamayo, and Else Marie Agger

5 Pathology of Tuberculosis: How the Pathology of Human Tuberculosis Informs and Directs Animal Models / 117
   Randall J. Basaraba and Robert L. Hunter

B. ANIMAL MODELS

6 Animal Models of Tuberculosis: An Overview / 131
   Ann Williams and Ian M. Orme

7 Mouse and Guinea Pig Models of Tuberculosis / 143
   Ian M. Orme and Diane J. Ordway

8 Non-Human Primate Models of Tuberculosis / 163
   Juliet C. Peña and Wen-Zhe Ho

9 Experimental Infection Models of Tuberculosis in Domestic Livestock / 177
   Bryce M. Buddle, H. Martin Vordermeier, and R. Glyn Hewinson

C. VACCINES

10 Clinical Testing of Tuberculosis Vaccine Candidates / 193
   Mark Hatherill, Derek Tait, and Helen McShane

D. HUMAN IMMUNOLOGY

11 Human Immunology of Tuberculosis / 213
   Thomas J. Scriba, Anna K. Coussens, and Helen A. Fletcher
## Contents

### SECTION II

**DRUG DISCOVERY AND DEVELOPMENT: STATE OF THE ART AND FUTURE DIRECTIONS** / 269

13 Preclinical Efficacy Testing of New Drug Candidates / 271
   **ERIC L. NUERMBERGER**

14 Oxidative Phosphorylation as a Target Space for Tuberculosis: Success, Caution, and Future Directions / 295
   **GREGORY M. COOK, KIEL HARDS, ELYSE DUNN, ADAM HEIKAL, YOSHIO NAKATANI, CHRIS GREENING, DEAN C. CRICK, FABIO L. FONTES, KEVIN PETHE, ERIK HASENOEHRL, AND MICHAEL BERNEY**

15 Targeting Phenotypically Tolerant *Mycobacterium tuberculosis* / 317
   **BEN GOLD AND CARL NATHAN**

### SECTION III

**BIOMARKERS AND DIAGNOSTICS** / 361

16 Tuberculosis Diagnostics: State of the Art and Future Directions / 363
   **MADHUKAR PAI, MARK P. NICOL, AND CATHARINA C. BOEHME**

17 Latent *Mycobacterium tuberculosis* Infection and Interferon-Gamma Release Assays / 379
   **MADHUKAR PAI AND MARCEL BEHR**

18 Impact of the GeneXpert MTB/RIF Technology on Tuberculosis Control / 389
   **WENDY SUSAN STEVENS, LESLEY SCOTT, LARA NOBLE, NATASHA GOUS, AND KEERTAN DHEDA**

### SECTION IV

**HOST AND STRAIN DIVERSITY** / 411

19 The Role of Host Genetics (and Genomics) in Tuberculosis / 413
   **VIVEK NARANBHAI**

20 The Evolutionary History, Demography, and Spread of the *Mycobacterium tuberculosis* Complex / 453
   **MAXIME BARRIER AND THIERRY WIRTH**

21 Impact of Genetic Diversity on the Biology of *Mycobacterium tuberculosis* Complex Strains / 475
   **STEVEN NIEMANN, MATTHIAS MERKER, THOMAS KOHL, AND PHILIP SUPPLY**

22 Evolution of *Mycobacterium tuberculosis*: New Insights into Pathogenicity and Drug Resistance / 495
   **EVA C. BORITSCH AND ROLAND BROSCH**

### SECTION V

**THE SIGNATURE PROBLEM OF TUBERCULOSIS PERSISTENCE** / 517

23 Acid-Fast Positive and Acid-Fast Negative *Mycobacterium tuberculosis*: The Koch Paradox / 519
   **CATHERINE VILCHÈZE AND LAURENT KREMER**

24 Mycobacterial Biofilms: Revisiting Tuberculosis Bacilli in Extracellular Necrotizing Lesions / 533
   **RANDALL J. BASARABA AND ANIL K. OJHA**

25 Killing *Mycobacterium tuberculosis In Vitro*: What Model Systems Can Teach Us / 541
   **TRACY L. KEISER AND GEORGIANA E. PURDY**

26 Epigenetic Phosphorylation Control of *Mycobacterium tuberculosis* Infection and Persistence / 557
   **MELISSA RICHARD-GREENBLATT AND YOSSEF AV-GAY**

27 DNA Replication in *Mycobacterium tuberculosis* / 581
   **ZANELE DITSE, MEINDERT H. LAMERS, AND DIGBY F. WARNER**

28 The Sec Pathways and Exportomes of *Mycobacterium tuberculosis* / 607
   **BRITTANY K. MILLER, KATELYN E. ZULAUF, AND MIRIAM BRAUNSTEIN**

29 The Role of ESX-1 in *Mycobacterium tuberculosis* Pathogenesis / 627
   **KA-WING WONG**

It is the height of irony that the man who discovered the smallpox vaccine, Edward Jenner, lost both his wife and son to tuberculosis (TB). By the time smallpox was essentially eradicated, it is estimated that over 300 million people had died from this disease over the preceding century. Its eventual prevention—by a simple vaccine—clearly illustrates the power of scientific discovery and how its application can affect human health. Hundreds of millions of people have been spared death and suffering from infectious diseases because of the development of vaccines and chemotherapeutic agents in the last 100 years. Millions of lives have been saved with the use of the TB vaccine, BCG, and the development of chemotherapeutic regimens for TB. Depressingly, despite these effective interventions, TB remains one of the most challenging problems of global health, with over 9 million new cases and 1.6 million deaths each year. This crisis has been further compounded by the emergence of the HIV epidemic, as this explosive and deadly combination has dramatically increased the global spread of TB, including increasing numbers of cases of multidrug-resistant (MDR) and extensively drug-resistant (XDR) TB.

Historically, mycobacterial disease has long been at the forefront of scientific discovery for infectious diseases. The leprosy bacillus, *Mycobacterium leprae*, the first bacterium to be associated with human disease, was initially visualized by Gerhard Armauer Hansen in 1873. Earlier, Jean Antoine Villemin was the first person to realize that lung tubercles were infectious and not cancerous. By the 1880s, Robert Koch, aware of both these discoveries, not only observed the tubercle bacilli in tubercles, but developed a growth medium of heated serum to cultivate the tubercle bacillus outside of humans. He went on to repeat the transfer experiment of Villemin and transferred the disease of TB to numerous animal species, establishing the experimental paradigm (“the postulates”) of how to prove that an infectious agent is a cause of a disease. Koch’s findings led Albert Calmette and Camille Guérin to follow Jenner’s approach of developing an attenuated pathogen for use as a vaccine, using the bovine tubercle bacillus to develop the bacille Calmette-Guérin (BCG) vaccine that bears their names and is still used to this day.

It is noteworthy that Paul Ehrlich was sitting in the lecture hall when Robert Koch presented his work in 1882; he later went on to help Koch improve his staining techniques. By observing the selective staining of various cell types, including human cells and different bacteria, Ehrlich also developed the idea of chemotherapy—“magic bullets” that could kill microbial pathogens. He tried for years to develop a chemical that could kill the tubercle bacillus, with little success, though at the same time was far more successful in developing a treatment for syphilis. In the 1930s, his protégé Gerhard Domagk discovered the first sulfonamide to treat bacterial infections such as streptococcus, and as this fledging field expanded, para-aminosalicylic acid and isoniazid were discovered to be active against the TB bacillus. Parallel studies by Salaman Waksman and Albert Schatz in the 1950s led to the discovery of streptomycin, the first bactericidal drug for the tubercle bacilli.

Despite these many historical advances, the TB bacillus—*Mycobacterium tuberculosis*—has proven to be a formidable adversary against numerous interventions. Nevertheless, despite the arduous challenges of
working with this dangerous pathogen, the field continues to persevere, and our continued success in the pursuit of knowledge would, we suspect, be applauded by Koch, Ehrlich, Calmette, and many others, as we strive to find and apply more effective cures for this dreadful disease. In this spirit, this textbook is a collection of state-of-the-art research aimed at understanding the TB bacillus, the way it infects its host, the mechanisms by which it persists in the face of host immunity, and current intervention and therapeutic methods. The contributors of this book believe that such continued and dedicated research efforts will eventually lead to better vaccines, better chemotherapies, and ultimately the eradication of TB—Edward Jenner’s revenge.

T cells, see also Memory T cells
cytotoxic, in TB-immune reconstitution
inflammatory syndrome (TB-IRIS),
255–256
*M. tuberculosis* infection, 217–219,
548–549
responses to tuberculosis (TB), 225
Technical Expert Group, 365
Thioalkalivibrio, 458
Thiorhodovibrio, 458
Thioalkalivibrio, 458
Thiorhodovibrio, 458
Thioridazine, 297, 299
Threonine auxotroph, 704
Time-lapse microscopy, 684–685
Tissue remodeling, tuberculosis (TB), 225
Toll-like receptor 9 (TLR9), 4
Toll-like receptors (TLRs), 7–8, 39, 145
Trained immunity, 13, 17, 107
Transcriptional profiling, M. tuberculosis in macrophages, 636–638
Transcriptome studies, 674, 683–684
Transcriptomic profiling, biomarkers, 226–227
Transforming growth factor β (TGFβ), 48
Transgenic mice, 145
TrasSH screening method, 704
Treatment outcomes, impact of GeneXpert Mtb/Rif, 401, 402–404
Trifluoperazine, 299, 300
Trudeau, E. L., 131
Tryphtan axotroph, 704–705
Tuberculin skin testing (TST), 213, 214, 215, 220, 221, 225
administering and reading TST, 381
latent TB infection, 380
purified protein derivative (PPD)-based TST, 381
Tuberculosis (TB), see also Animal models; HIV-TB coinfection; Human tuberculosis (TB); Vaccine candidates adjunctive therapeutic vaccination, 196–197
anti-TB vaccine design, 39
biomarkers in human, 226–227
diabetes mellitus, 222–223
diversity, 680
global epidemic, 389–390
HIV-1 heterogeneity at site of disease, 247
HIV-1 replication at site of disease, 245–247
HIV and, 172, 222
lung, 3–6
malnutrition, 223–224
necrotizing lesions in active pulmonary, 533–534
positive and negative roles of chemokines in, 36
positive and negative roles of cytokines in, 35
post-primary, 119–121, 123–127
preventing recurrent TB, 196–197
progression from infection to disease, 222–226
proposed framework for spectrum of infection, 380
protective memory against, 96–97
risk factors for, 222
systems biology of, 429
targeting replisome for new drug development, 595–596
Treg cell responses in human, 74–80
vaccine, 40, 43, 45, 46, 49
vaccine development strategies, 197–198
vitamin D deficiency, 223
Tuberculosis (TB) vaccination animal models, 80
guinea pig model, 86
mouse models, 83–84
Tumor necrosis factor alpha (TNFα), 34–37
roles in TB, 35
Type I interferons (IFN-γ), tuberculosis, 224
U
University of Pittsburgh, 166–167, 171
University of Zaragoza and Biofabri, 202
Urine lipoarabinomannan rapid test, 366
U.S. Food and Drug Administration (FDA), 382
V
Vaccine, vaccine candidate, 197, 198, 202
Vaccination
adjunctive therapeutic vaccination, 196–197
BCG and disease protection, 194
clinical trials of TB candidates, 197–203
M. tuberculosis, 95–96
prevention of M. tuberculosis infection, 193–195
prevention of recurrent TB disease, 196–197
prevention of TB disease, 195–196
Vaccine candidates, 198
Ad5Ag85A, 201
Crucell Ad35, 201
DAR-901, 202
development strategies, 197–198
experimental medicine role in development, 203–206
global clinical pipeline of, 198
H1:IC31 and H1:CAF01, 198
H4:IC31, 199
H56:IC31, 198–199
ID93+GLA-SE, 199
inactivated whole-cell and fragmented TB vaccines, 202
M72/AS01E, 199–200
MTBVAC, 202–203
MVA85A, 200–201
Protein-adjuvant TB vaccines, 198–200
recombinant mycobacterial vaccines, 202–203
RUTI, 202
secA2 mutant as, 619–620
TB/Flu-04L, 202
Vaccae, 202
VAP 1002, 203
viral-vector vaccines, 200–202
VPM 1002, 203
Vaccines, see also Vaccine candidates
Ad85A (human adenovirus 5 expressing Ag85A), 181–182
animal models and testing protocols, 136, 137
animal models for assessment of, 135
antibody-inducing, 220
BCG protection, 40, 43, 45, 46, 49, 220
BCG vaccination in animals, 100
BCG vaccination in guinea pigs, 86
BCG vaccination in humans, 76, 100
BCG vaccination in mice, 83–84
biomarkers correlating disease severity, 184
biomarkers predicting efficacy, 182
guinea pig model, 153–154
macaque models of evaluating TB vaccine, 167, 170
mechanism of protection, 136
memory immunity by novel TB, 107–108
Mycobacterium bovis bacillus Calmette-Guérin (BCG), 95, 117, 179–180
new-generation TB, 180–182
predictivity of animal models, 137–138
proof of concept for, 194, 196, 203–206
role of experimental medicine in vaccine development, 203–206
schedules of BCG and virally vectored, 183–184
types of new, tested in cattle, 181
Vakzine Projekt Management GmbH, 203
Valine axotroph, 704
Valinomycin, 297, 298
Vertex Pharmaceuticals, 643
Vibrio cholerae, 465
Viral-vector vaccines, 200–202
Vitamin B12 (cobalamin), 707–708
Vitamin B7 (biotin), 707
Vitamin B12 (folate), 707
Vitamin B12 (cobalamin), 707–708
Vitamin D deficiency, 223
W
Wallgren, Arvid, 215
Wayne model, hypoxia, 318, 323, 325
Whole-genome sequencing (WGS)
eMERgence of, 495
M. tuberculosis L2 Beijing sublineage, 500
resistant strains, 502, 506–507
World Health Organization (WHO), 193, 226, 239
global TB epidemic, 389–390
line probe assay recommendations, 368–369
TB disease control, 379, 533
TB screening, 363, 364
X
XLAAD (X-linked autoimmune allergic dysregulation syndrome), 73
Xpert Mtb/Rif, see also GeneXpert Mtb/Rif technology
background of, 391
diagnostics for TB, 365, 368
maximizing impact of new diagnostics, 371, 373–374
timeline of availability, 374
Y
Yersinia pseudotuberculosis, 674
Z
Zebrafish
animal models, 133, 685, 686
granuloma formation, 135
in vitro model, 530
M. marinum, 36, 133, 699
Ziehl, F., 520
